ViaLiteHD Network Module

- Monitor and control
- Operates over existing Ethernet networks
- Provides additional Ethernet connectivity over fibre
- Hot swappable
- Event logging and storage of events
- Auto configuration of replacement cards

Monitoring and Control

The ViaLiteHD network module uses the SNMP protocol to monitor and control RF over fibre equipment as well as offering an extension to existing Ethernet networks using optical fibre e.g. from a control centre to a remote ground station.

- Real-time monitor and control of all ViaLiteHD modules and power supplies.
- Four ethernet ports: one RJ45 port on card front; two RJ45 ports and one pair of optical ports on rear
- Easy integration with SNMP management systems
- All alarm information immediately accessible via any web browser or SNMP compliant management system
- Firewire IEE1394 craft port for module initialisation and security settings
- Displays operational status, voltage and temperature of SNMP module

The built-in graphical user interface can be accessed from any standard web browser using the IP address of the SNMP network monitoring module.

- Can be used for installation or test
- User definable alarm thresholds for temperature and voltage
- User definable access levels

The open architecture allows management of the alarm information using a range of third party management systems when connected via the local area network as part of the users monitoring and control system.

A ViaLiteHD 19” 3U rack system accepts up to 13 RF cards plus an SNMP control card. A 1U chassis accepts up to three cards. ViaLiteHD small form factor modules offer a compact, single link solution. OEM modules allow system integrators and equipment manufacturers to build RF/optical interfaces into their own design. A wide range of support modules and accessories are also available including indoor rack equipment and outdoor enclosures.

Due to our policy of continuing product development, these specifications are subject to change and improvement without notice.
