ViaLiteHD
RF Fibre Optic Link

User Guide

HRx-HB-7

CR3567 24/01/2017
Instrument Care and Safety Information

Please read the whole of this section before using your ViaLiteHD product. It contains important safety information and will enable you to get the most out of your Fibre Optic Link.

Electrical Safety

The ViaLiteHD chassis is a Safety Class 1 product (having metal case directly connected to earth via the power supply cable).

When operating the equipment note the following precautions:

- Hazardous voltages exist within the equipment. There are no user serviceable parts inside; the covers should only be removed by a qualified technician.
- There are no user replaceable fuses in the chassis mounted equipment. Replacement should only be carried out by a ViaLite Communications technician.
- The chassis earth stud SHOULD be connected to the safety earth.
- When using a 2 pin power supply cable the chassis earth stud MUST be connected to the safety earth.
- The ViaLiteHD Power Supply Modules do not have an isolating switch on the mains voltage inlet. For this reason, the ViaLiteHD Chassis must be installed within easy reach of a clearly labelled dual pole mains isolation switch, which supplies the equipment.

ESD Precautions

The ViaLiteHD RF Fibre Optic Link is equipped with high frequency active electronics, without the correct handling they will be susceptible to damage.

Precautions for handling electro-static sensitive devices should be observed when handling all ViaLiteHD modules. Technicians should ensure that they use effective personal grounding (i.e. ESD wrist strap etc.) when servicing the equipment. Any equipment or tools used should be grounded to prevent static charge build-up. Good practice should be observed at all times for reference see relevant standards.

EN 61340-5-1, “Protection of Electronic Devices from Electrostatic Phenomena – General Requirements”

Optical Safety

The ViaLiteHD RF Fibre Optic Transmitters, Dual Transmitters and Transceivers contain optical sources (usually laser diodes) operating at nominal wavelengths of 1270nm to 1610nm.

These devices are rated as EN60825-1:2007 as CLASS 1 radiation emitting devices. A class 1 laser is safe under all conditions of normal use.

When operating the equipment note the following precautions:

- Never look into the end of an optical fibre directly or by reflection either with the naked eye or through an optical instrument.
- Never leave equipment with radiating bare fibres – always cap the connectors.
- Do not remove equipment external covers when operating.

1 Introduction

The ViaLiteHD RF Fibre Optic Links (FOLs) are a family of fibre optically coupled link systems designed for the transmission of RF analogue signals over long distances for the communications market. ViaLiteHD is a product brand manufactured by Pulse Power and Measurement Ltd (PPM). ViaLite Communications is a division of Pulse Power and Measurement Ltd (PPM).

This handbook covers the following ViaLiteHD RF Link part numbers:
- Transmitter modules (electrical – optical converter) with part numbers starting HRT
- Receiver modules (optical - electrical converter) with part numbers starting HRR
- Transceiver modules (optical - electrical converter + electrical – optical converter) with part numbers starting HRX
- Dual Receiver modules (optical - electrical converter + optical - electrical converter) with part numbers starting HRV
- Dual Transmitter modules (electrical – optical converter + electrical – optical converter) with part numbers starting HRU

For complete information and product familiarisation, this handbook should be read in conjunction with all other relevant handbooks for your ViaLiteHD system.

1.1 Typical deployment

A typical system operates as follows.

The user’s RF electrical signal is input to the transmitter module, which contains RF signal conditioning and laser control circuitry. The module modulates the intensity of a beam of light with the RF signal.

The light travels through an optical fibre to the receiver module. The distance between transmitter and receiver can range from 1m to 100km; distance in excess of 100km can be achieved with more complex optical transport systems, depending on the system specified.

The receiver module converts the modulated light back into an electrical signal, which is available at the output of the module.

1.2 Care of fibre optic connectors

When the fibre optic cables are not connected, it is essential that the cable and equipment connectors are protected by the dust caps provided with the system. Failure to do so may result in damage to the fibre ends, which are critical to the system performance. Please refer to section 2.2 for fibre optic cable handling details.

1.3 ViaLiteHD and ViaLite Classic compatibility

The RF and optical interfaces of most ViaLiteHD and ViaLite Classic are compatible. However the physical size, mounting systems and control of the modules are different, so it will not be possible to fit ViaLiteHD modules in a ViaLite Classic chassis or housing and vice versa. However it is possible for chassis of different types to interwork and be used to expand existing systems. Listed below is a brief summary of inter family compatibility.

- RF links Compatible optical and RF interfaces
- RF + digital Compatible optical and RF interfaces
  - RS232 Compatible optical (check impact on optical link budget) and digital interfaces
  - RS422 Compatible optical (check impact on optical link budget) and digital interfaces
  - RS485 Compatible optical (check impact on optical link budget) and digital interfaces
- Ethernet Modules of matching speed have compatible optical and digital interfaces
- Switch Compatible RF interfaces may need interface cable (no optical interface)
- Splitters Compatible RF interfaces
- Amplifier Compatible RF interfaces
- Oscillator Compatible RF interfaces
- SNMP RJ45 interfaces maybe connected, control interface is not compatible,

Contact ViaLite Communications or your local ViaLite agent for more details.
2 Setting up and understanding the fibre optic link

This section describes the connections between your RF fibre optic transmitter (electrical – optical converter) and receiver (optical - electrical converter) modules, and the operation of both modules in a system.

Please read fully all relevant documents for information on installing your ViaLiteHD equipment before commissioning your RF fibre optic link system.

2.1 Module operation

2.1.1 5HP standard plug-in modules

All ViaLiteHD plug-in modules are hot-swappable, so it is not necessary to power-down the chassis before inserting a module. All standard optical connectors are retained by the module, so it will be necessary to either disconnect any cables or have a sufficiently long service loop when removing modules.

To install a 5HP standard module and matching interface plate

- The protective covers on the connectors may be left in place.
- Push the release button of the module handle down and simultaneously pull the top of the handle towards you.
- Align the module upright and perpendicular to the front face of the chassis so that the PCB slides into the “crow’s feet” card guides top and bottom.
- Gently push the module down its guide, applying pressure via the handle, you may also apply pressure between the LED and test connector (where test connector is fitted as these are not available on all module types).
- As the module is fully mated the top of the handle should snap back and lock in position.
- The pawls of the handle should be fully engaged in the matching slots.
- If power is applied to the chassis the module power LED should light as soon as the module is fully inserted
- Remove protective covers and connect any interface cables

To remove a 5HP Standard module

- Disconnect any cables if necessary
- Push the release button of the module handle down and simultaneously pull the top of the handle forwards.
- Apply pressure via the handle and gently withdraw the module from the chassis.
2.1.2 5HP blindmate plug-in modules

All ViaLiteHD plug-in modules are hot-swappable, so it is not necessary to power-down the chassis before inserting a module. All blindmate optical connectors are provided with spring loaded covers that will protect the optics of any inserted modules. As there is no cover on the opposite side, mating cables should not be installed until the slot modules are present.

To install a blindmate module and matching interface plate
- Firstly inspect the rear blind-mating plate [1], ensure that the connector barrels are fitted into all RF connectors and are centrally aligned.
- Remove protective covers from the inside face of the optical connector if fitted.
- Ensure that the rear plate is free of any dust and contamination, if necessary clean with filtered compressed air.
- Screw the blind-mating plate into the appropriate slot at the rear of the chassis, using the supplied screws and a “Pozidriv Number 1” screwdriver [2]
- Push the release button of the module handle down and simultaneously pull the top of the handle towards you.
- Remove the protective cover from the modules optical connectors and clean any optical connectors [3]
- Align the module upright and perpendicular to the front face of the chassis so that the PCB slides into the “crow’s feet” card guides top and bottom.
- Gently push the module down its guide, applying pressure via the handle (without locking it), you may also apply pressure between the LED and test connector (where test connectors are fitted as these are not available on all module types) [4].
- As the module is fully mated the top of the handle should snap back and lock in position.
- The pawls of the handle should be fully engaged in the matching slots.
- If power is applied to the chassis the module power LED should light as soon as the module is fully inserted.
- Connect any interface cables to the blind mate plate, at the rear of the chassis.

To remove a blindmate module
- Push the release button of the module handle down and simultaneously pull the top of the handle towards you.
- Apply pressure via the handle and gently withdraw the module from the chassis.
- Check that the RF mating barrel is retained by the chassis blind-mating plate
- All cables with be retained by the chassis case.

Note: if modules are absent for an extended period there is a chance of the optical fibres being contaminated as the optical mating interface is unprotected. If this happens it will be necessary to clean both the blind-mating adaptor and fibre optic cable.
2.1.3 Blue link modules

The Blue link module is fully enclosed and built with connectorised interfaces with electromagnetic shielding. This allows system integrators and equipment manufacturers an easy route to build RF/optical interfaces into their own equipment. The small form factor and integrated design should allow the module to be easily integrated into end user equipment.

2.1.4 Yellow link modules

The very small form factor Yellow link module has an edge connector for DC and alarm connections, an integrated RF shield, and a very small overall form factor. This allows system integrators and equipment manufacturers to very simply integrate this on a motherboard giving an easy route to build RF/optical interfaces into their own design. The low volume of this module allows it to easily be fitted into existing mechanical housings.
2.2 Fibre optic cable & connectors

2.2.1 Connector and cable types
All ViaLiteHD RF modules use singlemode (9µm/125µm) cable terminated in a range of optical connectors detailed below. Cross-site fibre optic cables are available from ViaLite Communications as either standard patch leads or heavy-duty multicore cables.

Warning! Angle polished (APC) and standard (PC) connector must not be confused. The two connector-types are not interchangeable and mating one with the other will damage both the cable and the module connectors.

Warning! The specification of optical connector is critical to the performance of the complete fibre optic link. System performance can only be guaranteed with fibre optic cables and connectors supplied by ViaLite Communications. When FC/APC connectors are specified they must be “narrow key width”

2.2.2 Connecting and disconnecting
Before connecting optical fibres to the module or to each other, ensure that the mating connectors are clean (see below).

2.2.3 Cleaning optical connectors, cleaning before every use
Optical connectors MUST be cleaned before use, even where they have been protected with dust caps. Most performance issues are due to dirty fibres.

For more details please read the cleaning instruction which accompanies the connector cleaning kit. Details can also be found on the CD supplied with your equipment.

2.2.4 Cleaning optical connectors, high levels of contamination
If there are performance issues that are not resolved by basic cleaning in section 2.2.3, then the following procedure should be used. If the level of contamination is high it will be necessary to repeat this procedure.

Cleaning items required
- Lint free fibre cleaning tissues and/or cleaning sticks (normal cosmetic tissues produce dust and are not acceptable).
- Reagent grade Iso Propyl Alcohol (IPA).
- Air duster or filtered compressed air line.

Cable Connector Cleaning
- Dampen a patch of cleaning tissue with IPA and clean all surfaces of the plug ferrule.
- Using a dry cleaning tissue, dry the ferrule and clean the end face.
- Using the air duster, blow away any residue from the end of the connector.

Module Female Receptacle Cleaning (only recommended if problems are being experienced)
- Either use an optical cleaning stick or twist a cleaning tissue to form a stiff probe, moisten either with IPA. Gently push the probe into the receptacle and twist around several times to dislodge any dirt.
- Repeat the above process with a dry tissue.
- Using the air duster, blow away any residue from the receptacle.

Important Notes
- IPA is flammable. Follow appropriate precautions / local guidelines when handling and storing.
- IPA can be harmful if spilt on skin. Use appropriate protection when handling.
- It should only be necessary to clean the female receptacles on the modules if problems are being experienced.

Never inspect an optical fibre or connector with the naked eye or an instrument unless you are convinced that there is no optical radiation being emitted by the fibre. Remove all power sources to all modules, and completely disconnect the optical fibres.
### 2.2.4.1 FC/APC Connectors

All *ViaLiteHD* FC connectorised modules use FC/APC (narrow key). Clean the plug before inserting see section 2.2.3.

To connect FC/APC optical connectors:
- Remove the dust caps and align the white ceramic centre ferrule on the cable connector with the mating receptacle.
- There is a key (lug) on the side of the ferrule, which must match the keyway (gap) in the receptacle shroud.
- When they are aligned, gently push the plug home.
- Finger tighten the knurled collet nut onto the threaded receptacle.

To disconnect:
- Using fingers fully unscrew the knurled collet nut, gently withdraw the connector.
- Replace the dust caps on both the receptacle and the cable plug.

**Warning!** It is possible to tighten the knurled collet without aligning the lug and gap. This will result in poor light transmission. Check that the lug and gap are aligned before tightening the knurled collet.

### 2.2.4.2 E2000/APC Connectors

All *ViaLiteHD* E2000 connectorised modules use E2000/APC. Clean the plug before inserting see section 2.2.3.

To connect E2000/APC optical connectors:
- Gently push the plug into the E2000/APC adapter.
- The cover will automatically disengage.
- Push until a click is heard and the connector locks.

To disconnect:
- To disconnect, depress the lever at the rear of the connector and withdraw the connector.
- The protective cover automatically engages when removed.

Only connect FC/APC cable to FC/APC modules  
Only connect E2000/APC cable to E2000/APC adaptors.
2.2.4.3 SC/APC Connectors (fitted to standard modules)

All ViaLiteHD SC connectorised modules use SC/APC. Clean the plug before inserting see section 2.2.3.

To connect SC/APC optical connectors:-
- Remove the plug protective cover.
- Align the connector keyway slot in the adaptor to the key of the plug.
- Gently push the plug-into the adapter until a click is heard and the connector locks.

To disconnect:-
- grip the body of the plug and gently pull the plug from the adaptor, replace the protective cover.

Only connect SC/APC cable to SC/APC.

2.2.4.4 SC/APC Connectors (fitted to blindmate modules)

All ViaLiteHD blindmate connectorised modules use SC/APC optical connectors on the chassis rear interface. Clean the plug before inserting see section 2.2.3.

To connect SC/APC optical connectors:-
- Remove the plug protective cover.
- Open the adaptor sprung cover, align the connector keyway slot in the adaptor to the key of the plug.
- Gently push the plug-into the adapter until a click is heard and the connector locks.

To disconnect:-
- Grip the body of the plug and gently pull the plug from the adaptor, replace the protective cover.
- The adaptor sprung cover, will automatically close.

Only connect SC/APC cable to blindmate SC. Position of keyway behind protective cover.
2.2.4.5 LC/APC Connectors

All ViaLiteHD LC connectorised modules use LC/APC. Clean the plug, before inserting see section 2.2.3.

To connect LC/APC optical connectors:
- Remove the plug protective cover.
- Align the connector latch to the adaptor.
- Gently push the plug-into the adapter until a click is heard and the latch locks.

To disconnect:
- Grip the body of the plug and push down on the latch.
- While holding the latch down, gently pull the plug from the adaptor, replace the protective cover.

Only connect LC/APC cable to LC/APC.

2.2.5 Minimum bend radius

Because optical fibre is made of glass, it is important not to subject it to excessive stress. For this reason, each type of cable has a minimum bend radius (MBR) specification, beyond which the cable cannot be bent without permanent damage occurring. Systems using longer wavelength (i.e. 1550nm) are less tolerant to small bend radii.

The minimum bend radius of standard SMF28 fibre optic cable fitted to ViaLiteHD modules is 50mm. MBR specifications for ViaLite Communications supplied fibre optic cables are given in the ViaLite Classic and ViaLiteHD System Handbooks Lxx-HB and Hxx-HB respectively.
2.3 Using the RF link module

2.3.1 Connecting the module

Connect the transmitter module to the power source, cross-site fibre optic cable and RF signal as described in section 2.1. The RF input signal applied to the signal connector should be within the maximum and minimum signal levels given in the technical specifications in section 6.

2.3.2 Front panel indicators, plug-in modules

Each plug-in module has three front panel LEDs for indication of the state of the module. The following table shows the operation of the front panel LEDs which are dependent on module type.

2.3.4 Module summary alarm

Each module has a single summary alarm, which registers the status of the module. Activation of this alarm registers an internal fault and the module should be replaced with a spare and returned to your local ViaLiteHD representative. The alarm state should be accompanied by a fault status on one of the front panel status LEDs.

The summary alarm is indicated by use of open drain logic. The alarm logic is OPEN when in an ALARM state and SHORT when in a NORMAL (non-alarm) state. The module will remain in an ALARM state until the ALARM condition is cleared, there is no latching.

2.3.5 Connecting to the summary alarm

The alarm output pin should be connected to a suitable current source (a positive voltage via a 10kohm pull-up resistor is adequate). When the module is in a working (non-alarm) state, the alarm output pin is short circuited to ground by the module. If the module enters an alarm state, the alarm pin is released to a high impedance state and current is no longer drawn from the constant current source. In the case of a positive voltage and pull-up resistor, the voltage on the alarm output pin will rise to indicate the alarm state. It follows that, if a module is removed from the chassis, the alarm will be raised for that module position.

The capability of the open collector is dependent on the module that provides it. The typical capability of the Open Collector/Drain is 50mA maximum current sink and 15V maximum voltage (Vext).

Note: Modules fitted in a chassis may have their alarm lines pull up by other chassis equipment, such as switch, splitter, summary alarm or SNMP and web controller modules.

2.3.6 Received light level RLL alarm

All modules equipped with receivers, monitor the average incoming received light level (RLL), if the power drops below a pre-set threshold the module will generate an RLL alarm.

For units with single function optical port (i.e. without WDM see section 2.3.10.1), the pre-set thresholds are shown below

- The RLL alarm threshold is set for a nominal input power of -14.5dBm @ 1310nm
  - Nominal optical loss of 20.0dB @ for a standard DFB 4.5dBm (3mW) TX @ 1310nm
  - Nominal optical loss of 21.5dB @ for a standard DWDM 7.0dBm (5mW) TX @ 1310nm
  - Nominal optical loss of 23.5dB @ for a high power DFB 9.0dBm (8mW) TX @ 1310nm
  - Nominal optical loss of 25.5dB @ for a high power DWDM 10.8dBm (12mW) TX @ 1310nm
- The RLL alarm threshold is set for a nominal input power of -15.0dBm @ 1550nm
  - Nominal optical loss of 20.5dB @ for a standard DFB 4.5dBm (3mW) TX @ 1550nm
  - Nominal optical loss of 22.0dB @ for a standard DWDM 7.0dBm (5mW) TX @ 1550nm
  - Nominal optical loss of 24.0dB @ for a high power DFB 9.0dBm (8mW) TX @ 1550nm
  - Nominal optical loss of 25.8dB @ for a high power DFB 10.8dBm (12mW) TX @ 1550nm

For units with WDM combined optical ports (see section 2.3.10.3), the pre-set thresholds are shown below

- The RLL alarm threshold is set for a nominal input power of -13.5dBm @ 1310nm
  - Nominal optical loss of 19.0dB @ for a standard DFB 4.5dBm (3mW) TX @ 1310nm
  - Nominal optical loss of 20.5dB @ for a standard DWDM 7.0dBm (5mW) TX @ 1310nm
  - Nominal optical loss of 22.5dB @ for a high power DFB 9.0dBm (8mW) TX @ 1310nm
  - Nominal optical loss of 24.5dB @ for a high power DWDM 10.8dBm (12mW) TX @ 1310nm
- The RLL alarm threshold is set for a nominal input power of -14.0dBm @ 1550nm
  - Nominal optical loss of 19.5dB @ for a standard DFB 4.5dBm (3mW) TX @ 1550nm
  - Nominal optical loss of 21.0dB @ for a standard DWDM 7.0dBm (5mW) TX @ 1550nm
  - Nominal optical loss of 23.0dB @ for a high power DFB 9.0dBm (8mW) TX @ 1550nm
  - Nominal optical loss of 24.9dB @ for a high power DWDM 10.8dBm (12mW) TX @ 1550nm

Under normal operating conditions the RLL alarm accuracy is +/-2dB; and +/-4dB under extreme conditions.
2.3.7 Module analogue monitor

Each plug-in module has either one or two analogue monitor ports. These allow simple DC indication of the status of either lasers or photodiodes fitted in the RF modules. The analogue monitor is available on the chassis connector, see the chassis handbook. The analogue monitor functions are dependent on the type of module. The monitor function(s) provided are shown in the table below.

<table>
<thead>
<tr>

2.3.8 RF connectors

ViaLiteHD products are fitted with a range of standard RF connectors. The RF modules are all fitted with FEMALE connectors. When connecting the modules ensure that you have both the correct type and impedance of connector. Listed below are the connector types available.

Front panel test connectors (optional on some plug-in and blindmate modules only)

- BNC 50 ohms bayonet
- BNC 75 ohms bayonet

Rear Input / Output connectors, plug-in modules

- SMA 50 ohms screw on
- BNC 75 ohms bayonet
- F-Type 75 ohms screw on
Input / Output connectors Blue link and Yellow link modules

- SMA 50 ohms screw on
- MCX 50 ohms push fit
- MCX 75 ohms push fit

Not all connector types are available on all types of module. If you are unsure of the connector type your module is fitted with this can be determined from the part number (see section 5). Blind-mating modules are fitted with a floating RF connector, mating between the plug-in module and the chassis rear plate. This is a purely internal interface and should not be connected by any means other than via the supplied chassis interface.

**Warning!** Use of incorrect impedance connectors may also cause intermittent connections and in extreme cases result in physical damage to the connector.

**Warning!** Use of incorrect impedance connector will result in mismatch increasing the system loss and reducing RF flatness.

**Warning!** Use of incorrect impedance cable will result in mismatch increasing the system loss and reducing RF flatness.
2.3.9 RF test ports

Some modules are fitted with RF test ports, these modules will have one or two test ports. These ports can be used to provide an indication of the signals being input and output from the rear ports without the need to monitor them directly. The RF impedance of the test port matches that of the rear connector. Standard test ports are either 50 ohm BNC or 75 ohm BNC. A non-standard option of 50 ohm SMA is available, contact ViaLite Communications for more details.

The port lettering convention for front ports matches that for rear ports. Port A is always the upper port, Port B is always the lower port.

<td>Receiver L-Band HTS</td>
</tr>
</tbody>
</table>

Frequency types “J” and “K”, L-Band HTS + Reference modules

To minimise the impact on the main RF path, the test port is coupled at a low level compared to the main path. The coupling efficiency of the test port relative to the main path is relatively flat versus frequency and can be predicted using the following graphs, which outline typical performance. The graphs show the typical performance of the 4 types of coupling ports from 10kHz to 4GHz, types of test port are.

- 50ohm modules without diplexer (typically -20dB TX and RX)
- 75ohm modules without diplexer (typically -14dB RX and -26dB TX)
- 50ohm modules with diplexer (typically -19dB RX and -21dB TX)
- 75ohm modules with diplexer (typically -13dB RX and -27dB TX)

The operation of the test port is accurate across the specified operating range of the module, see the technical specification section 6. All test ports have a minimum operating frequency of 10kHz, measurements taken below 10kHz will have reduced accuracy. To ensure accurate operation, the signal ports need to be terminated with a well matched load, poor matching will degrade the accuracy of the coupling factor.
Module types “J” and “K” fitted with RF diplexers, coupling factor of front port relative to rear port (dB) versus Frequency (GHz)

N = Non-standard, For non-standard options contact ViaLite Communications.  
X = Not available  
- = Not used on this module type

Note: Only use the rear RF connections for your input and output signals.

2.3.10 RF and optical rear input and output ports

2.3.10.1 Single function RF and optical rear input and output ports

All ViaLiteHD modules are fitted with one or two rear RF ports and one or two rear optical ports. These are for the input of RF signals to transmitters and output of RF signals from receivers; output optical signals from transmitters and input optical signals to receivers.

The port lettering convention for rear ports matches that for front ports. The upper of each port is port A and the lower is port B. On single receiver and single transmitter modules the optical and RF port use the outer most positions to maximise accessibility.  
Note: All new blindmate modules are supplied with an appropriate chassis interface plate.

If you wish to pre-populate and cable your blindmate chassis in advance, chassis plates can be purchased as spares, see section 2.3.10.5.

All module types except frequency types “J” and “K”
2.3.10.2 Labelling convention for Dual channel WDM/CWDM units

When ViaLiteHD dual TX modules are fitted with two different CWDM wavelength channels, they obey the convention that the lower value wavelength is used for the TOP "A" port and higher wavelength is used for the BOTTOM "B" port. An example is shown below.

- Module Type: HRU-L1-8D-33-C1550-1570 uses dual channel blindmate interface as shown above, left
- Port A: 1550nm on TOP, SC/APC connector
- Port B: 1570nm on BOTTOM, SC/APC connector

2.3.10.3 Diplexed RF rear input and output ports

The L-Band HTS + Reference modules can optionally be fitted with internal diplexers these combine the L-Band HTS and Reference channels into a single RF port, the port is normally labelled A+B for easy identification.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Frequency types “J” and “K”, L-Band HTS + Reference modules, with one optical port

The additional optical loss introduced by the WDM module and the isolation between the two optical channels, requires that the alarm threshold is reduced to eliminate the chance of the RLL alarm malfunctioning. The typical alarm levels are given in section 2.3.6.

The WDM will reduce the isolation between the two optical paths, the optical isolation will be greater than 20dB, giving a typical RF isolation of 45dB.

2.3.10.5 Separate blindmate panels

If you wish to pre-populate and cable your blindmate chassis in advance, chassis plates can be purchased as spares, details below.

- PPM part number 85058 ViaLiteHD, Chassis plate, Blindmate, 1 * SMA 50ohms, 1 * SC/APC
- PPM part number 85059 ViaLiteHD, Chassis plate, Blindmate, 2 * SMA 50ohms, 2 * SC/APC
- PPM part number 85060 ViaLiteHD, Chassis plate, Blindmate, 1 * BNC 75ohms, 1 * SC/APC
- PPM part number 85061 ViaLiteHD, Chassis plate, Blindmate, 2 * BNC 75ohms, 2 * SC/APC
- PPM part number 85064 ViaLiteHD, Chassis plate, Blindmate, 1 * F-Type 75ohms, 1 * SC/APC
- PPM part number 85065 ViaLiteHD, Chassis plate, Blindmate, 2 * F-Type 75ohms, 2 * SC/APC
- PPM part number 85066 ViaLiteHD, Chassis plate, Blindmate, 2 * SMA 50ohms
- PPM part number 85067 ViaLiteHD, Chassis plate, Blindmate, 3 * SMA 50ohms
2.3.11  Digital signal ports

Any ViaLiteHD RF module which is fitted with a digital transmission path, has these digital signal interfaces connected via the chassis backplane (plug-in or blindmate modules) or the main interface connector (Blue link and Yellow link modules). Details of the pin outs are given in the chassis manual for plug-in modules and in section 4.3.2 of this manual for Blue link and Yellow link modules.

2.4  Controlling RF modules

ViaLiteHD RF links are factory set and ready to operate. However, they can be software controlled (where an SNMP module is used in the same chassis) or manually controlled via the DIP switches fitted on each module.

2.4.1  Manual control, MGC

The plug-in modules can be manually configured to set various operational parameters. The dual in line package (DIP) switches SW1, SW2, SW3 control configuration and are located on the bottom side of the PCB. These switches can be accessed by withdrawing the module by approximately one-third of its length. Two or three sets of switches will be installed depending on the type of module. Details of the function of each switch are given in the section below.

2.4.2  Manual control, DIP switch functions

Located on the bottom side of the module board, three DIP switches (SW1 to 3) provide manual control of various functions. SW1 and SW2 are dedicated to manual gain control (MGC). Once TX_MGC_ON or RX_MGC_ON is switched on, internal RF attenuators can be set directly to a desired level. SW3 is used to control various common control functions.

All intelligent modules will be delivered with DIP switches all set to OFF (clear). Only special manual gain control modules will be delivered with the DIP switches set to factory calibrated gain settings.

The switch arrangement for the Dual Transmitter and Dual Receiver look similar to the Transceiver but with the top switch SW1 assigned to (TX1 and RX1 respectively) and the middle switch SW2 assigned to (TX2 and RX2 respectively); details are shown below.

### 2.4.2.1 DIP switches - receiver MGC

The RF gain within the receiver function is the sum of all gain settings on SW1. The RF gain can be changed in nominal steps of 0.5dB. For dual receiver modules, channel 1 is controlled by switches prefixed with RX1 and channel 2 is controlled by switches prefixed with RX2. The function of the switches is otherwise identical.

For special manual gain control modules record the factory setting of each gain step; this is the preset gain of the receiver.

- **RXMGC**
  - **ON** = Module under manual gain control
  - **OFF** = Module under software control or at default setting
- **RX - 0.5dB**
  - **ON** = Gain increased by 0.5dB nominal
  - **OFF** = no gain increase
- **RX - 1dB**
  - **ON** = Gain increased by 1dB nominal
  - **OFF** = no gain increase
- **RX - 2dB**
  - **ON** = Gain increased by 2dB nominal
  - **OFF** = no gain increase
- **RX - 4dB**
  - **ON** = Gain increased by 4dB nominal
  - **OFF** = no gain increase
- **RX - 8dB**
  - **ON** = Gain increased by 8dB nominal
  - **OFF** = no gain increase

When MGC is not in use, manual attenuation has to be set to zero, i.e. all poles with the same switch should return to OFF position. Failure to do so may prevent the module from controlling the gain correctly.

### 2.4.2.2 DIP switches - transmitter MGC

The RF gain within the transmitter function is the sum of all attenuator settings on SW2. The RF gain can be changed in nominal steps of 0.5dB. For dual transmitter modules, channel 1 is controlled by switches prefixed with TX1 and channel 2 is controlled by switches prefixed with TX2. The function of the switches is otherwise identical.

For special manual gain control modules record the factory setting of each gain step; this is the preset gain of the transmitter.

- **TXMGC**
  - **ON** = Module under manual gain control
  - **OFF** = Module under software control or at default setting
- **TX - 0.5dB**
  - **ON** = Gain increased by 0.5dB nominal
  - **OFF** = no gain increase
- **TX - 1dB**
  - **ON** = Gain increased by 1dB nominal
  - **OFF** = no gain increase
- **TX - 2dB**
  - **ON** = Gain increased by 2dB nominal
  - **OFF** = no gain increase
- **TX - 4dB**
  - **ON** = Gain increased by 4dB nominal
  - **OFF** = no gain increase
- **TX - 8dB**
  - **ON** = Gain increased by 8dB nominal
  - **OFF** = no gain increase

When MGC is not in use, manual attenuation has to be set to zero, i.e. all poles with the same switch should return to OFF position. Failure to do so may prevent the module from controlling the gain correctly.

### 2.4.2.3 Manual gain control example

In this example we consider a receiver. The factory set values will typically be in the mid-range of the allowable gain setting range, to allow the operator to both increase and decrease the gain of the unit if desired.

- The factory set values are TX – 0.5dB = ON; TX – 1dB = OFF; TX – 2dB = ON; TX – 4dB = ON; TX – 8dB = OFF.
- This is a total gain of 0.5 + 2 + 4 = 6.5dB [this will be the factory preset gain]

The operator wishes to increase the gain by 3dB from factory preset gain, he must increase the DIP switch set gain from 6.5dB to 9.5dB

- The new gain setting desired will be 9.5dB, made from the following steps 0.5 + 1 + 8, therefore set the switches as shown below
  - TX – 0.5dB = ON; TX – 1dB = ON; TX – 2dB = OFF; TX – 4dB = OFF; TX – 8dB = ON.
  - The new gain is now set to 9.5dB

Note: The gain of the link is the sum of the transmitter module and receiver module gains.
2.4.2.4 DIP switches - control

If you wish to use manual control we advise that you record the initial setting of each switch, this is the preset configuration of the module. SW3 control functions are common to the whole module. The on-board micro controllers can be manually reset by using TX_RESET and/or RX_RESET, they must return to the OFF (clear) position to initiate the actual reset sequence.

Switching on SNMP_dis will disable the module I2C bus for that module. In this case, SNMP controller or other I2C hosts will be unable to talk to the module.

RF auto gain control (AGC) function can be activated by setting TX_AGc_ON and RX_AGc_ON to ON (set) position. However, AGC mode will be overridden by MGC mode if both modes are selected. These will override module internal soft gain control. Some modules will have control functions indicated that are not used, such as RX_rst in a single transmitter module. Switches for these “not used” positions should always be left in the OFF (clear) position.

* TX rst Reset TX microcontroller by moving switch from OFF > ON > OFF, ensure that it is returned to the OFF position**
* RX rst Reset RX microcontroller by moving switch from OFF > ON > OFF, ensure that it is returned to the OFF position**
* SNMP_dis ON = I2C bus disabled (module cannot be remotely accessed), OFF = I2C bus enabled
* Tone ON = 22kHz tone present, OFF = 22kHz tone disabled
* VSEL ON = Internal module LNB PSU voltage set to 18V, OFF = Internal module LNB PSU voltage set to 13V
* LNB ON = Internal module LNB PSU enabled, OFF = Internal module LNB PSU disabled
* TXAGC* ON = TX AGC control function activate, OFF = TX AGC control function disabled
* RXAGC* ON = RX AGC control function activate, OFF = RX AGC control function disabled

* Not available on manual control modules
** Must be power to perform reset action, removing power will also reset a module

2.4.3 Changing module RF gain

The performance specifications in section 6 are only valid when modules are operated in the factory preset configuration. However, the gain of the modules can be changed to suit customer requirements.

The performance of the transmitter is highly dependent on the laser diode. Changing transmitter and receiver gain will affect the sensitivity and linearity of the module. Detail of these effects are provided in section 3.2.

2.4.4 Software control - via SNMP controller

ViaLiteHD RF links can be controlled via a ViaLiteHD SNMP control module when fitted in the same chassis, see the SNMP controller module handbook for further details. The SNMP module offers control via both a web interface and SNMP.

Remember if you wish to use software control the manual attenuation has to be set to zero, i.e. all poles of the switch should return to the OFF position. Failure to do so may prevent the module from controlling the gain correctly.

2.5 LNA/LNB feed

All information in this section refers to fibre optic transmitter, dual transmitter and transceiver modules. LNA voltages are fed out through the TX RF input connector on the modules and can be used to power connected equipment. Precautions must be taken to ensure that any connected equipment is tolerant of the DC voltages supplied.

2.5.1 LNA/LNB feed - transmitter modules

Transmitter modules may provide a lower noise amplifier (LNA) or low noise block down converter (LNB) power feeds. These provide a DC path to the transmitter RF input to provide power to a LNA/LNB or other connected module. The external DC paths (option 3) of a module may be accessed via the chassis connector for plug-in and blindmate modules (see your chassis handbook), the edge connector for Yellow link modules (see section 4.3.2) or the Molex connector of Blue link modules (see section 4.3.3). The LNA/LNB option can be determined from the part number.

Modules in this range offer a variety of feed options, shown below.

0 - No LNA feed
1 - Internally generated preset +5 ± 0.5V at 80mA maximum per channel
2 - Internally generated preset +12 ± 1V at 300mA maximum per channel (Limited to 80mA for low frequency "T modules per output")
3 - External Feed from chassis connector 0 to +28V at 350mA per channel (Limited to 80mA for low frequency "T modules per output")
4 - 20kb/s RS484/422/232 signal channel, No LNA feed
5 - Internally generated +13.4 ± 1 or +18.5 ± 1 or +22 ± 1V selectable LNB voltage, with switchable 22kHz signalling tone. 700mA per channel for single transimt channel (i.e. single transmitter or transceiver module).
6 - 350mA per channel for dual transmit channel, 700mA total (i.e. dual transmitter module).
7 - GPS load simulator with internally generated preset +5 ± 0.5V at 80mA maximum per channel
8 - Dual module with RF diplexer, external feed 0 to +28V at 350mA from L-Band HTS TX to diplexed output (L-Band HTS + reference ONLY)
9 - 20kb/s RS485/422/232 channel, External Feed from chassis connector 0 to +28V at 350mA per channel
A - IRIG Low frequency extension to ~100Hz, No LNA feed
B - Not used as an LNA/LNB feed option
C - 20kb/s TTL channel, No LNA feed

### 2.5.2 LNA/LNB feed efficiency - plug-in modules

The power consumption of a transmitter is specified without allowance for LNA/LNB power. When calculating power consumption the module efficiency of the LNA/LNB power supply at full load is 89% typically and 80% minimum

### 2.5.3 LNA/LNB voltage boost - plug-in modules

The output voltage of any module equipped with an internal 13/18/22 volt power supply (option “5” and “8”) can have its output voltage increased to allow for cable losses, the output voltage is increased by +1V nominally. This is implemented using the modules software configuration. This option is NOT available on units equipped with +5V, +12V or external voltage feeds.

### 2.5.4 External voltage feeds on low frequency capable TX modules

TX modules fitted with an option “3” external feed, which are capable of operation to 10MHz and below (frequency types B,M,N,S,T,W), SHOULD NOT transmit a 22kHz tone. These modules are fitted with a large parallel capacitor between the external voltage feed input and ground, this protects the units from LNA/LNB voltage “switch on” transients which would otherwise damage the unit. This capacitor significantly attenuates the 22kHz tone signal, reducing it below typical operational thresholds at the RF input. This does not affect other option “3” external feed modules which may be used with a 22kHz tone via the external feed (frequency types D,G,L,K), contact ViaLite Communications for more details.

### 2.5.5 LNA/LNB Feeds - dual transmitter modules

LNA/LNB power supply feeds are available for dual transmitter modules.

- Modules fitted with internally generated power source options “2” (+12V) or “5” and “8” (13/18/22kHz) share a single power source that feeds both bias tees. Hence there will be no low frequency electrical isolation between them.
- Modules fitted with internally generated power source option “1” and “6” (+5V) are powered from separately regulated supplies and have a high level of low frequency isolation.
- Modules with no LNA feed, options “0”, “4”, “A” and “C” have no DC connections and hence both inputs are isolated inside the module.
- Modules fitted with externally generated power sources are each fed from separate pins, hence both inputs are isolated inside the module.

### 2.5.6 LNA feed - Blue link and Yellow link modules

Modules in this range offer an internally +5V/+12V feeds and external feed only. Some modules do offer an ability to route a user fed LNA voltage through from their DC input connector. When using some ViaLite Outdoor Enclosures, external LNA feeds are available via the outdoor enclosure motherboard.

### 2.5.7 LNA feed – Low frequency “T” module

Low frequency “T” modules have the capability of LNA feed, but due to the large value of the inductors used, the maximum current available for any type of LNA feed is 80mA.
Care must be taken not to draw excess current as the bias the bias inductor is not protected by a fuse and gross over rating will cause permanent damage.

2.5.8 **LNA feed – Voltage versus current characteristic**

The LNA voltage is fed via an inductor (providing RF isolation) a low value resistor (used for current monitoring) and a resettable fuse (providing protection). These elements add a series impedance of approximately one ohm. The graph below shows how the voltage current characteristic of a typical module with 12 volts fed to into the LNA feed via an external feed from the module connector "LNA feed" pin.

When using LNA/LNB feeds care must be taken to allow for voltage drops through the input feed network as well as voltage drops in the output feed network. For example RG58 may have a resistance of up to 0.2 ohms per meter; this varies greatly between different types and constructions of cable.

![Graph showing LNA feed – Voltage versus current characteristic](image)

**NOTE:** the graph shows the module operating beyond its specification limit to illustrate the margin of safe operation, it should not be operated beyond its specification limit.

### 2.6 BUC feed

All information in this section refers to fibre optic receiver, dual receiver and transceiver modules. BUC voltages are fed out through the RX RF output connector on the modules and can be used to power connected equipment. **Precautions must be taken to ensure that any connected equipment is tolerant of the DC voltages supplied.**

#### 2.6.1 BUC feed - receiver modules

Receiver modules may optionally provide block up converter (BUC) power feeds. These provide a DC path to the receiver RF output to provide power to a BUC or other connected module. The external DC paths (option 3) of a module may be accessed via the chassis connector for Plug-in and blindmate modules (see your chassis handbook), the edge connector for Yellow link modules (see section 4.3.2) or the Molex connector of Blue link modules (see section 4.3.3). The BUC option can be determined from the part number.

### 2.6.2 BUC feed - dual receiver modules

BUC power supply feeds are available for dual receiver modules.

Modules fitted with internally generated power source options “2” (+12V) or “5” and “8” (13/18/22kHz) share a single power source that feeds both bias tees. Hence there will be no low frequency electrical isolation between them.

Modules fitted with internally generated power source option “1” and “6” (+5V) are power from separately regulated supplies and have a high level of low frequency isolation.

Modules with no BUC feed, options “0”, “4”, “A”, “B” and “C” have no DC connections and hence both inputs are isolated inside the module.

Modules fitted with externally generated power sources are each fed from separate pins; hence both outputs are isolated inside the module.

### 2.6.3 BUC voltage boost - plug-in modules

The output voltage of any module equipped with an internal 13/18/22 volt power supply (option “5” and “8”) can have its output voltage increased to allow for cable losses, the output voltage is increased by +1V nominally. This is implemented using the modules software configuration. This option is NOT available on units equipped with +5V, +12V or external voltage feeds.

### 2.7 Manual configuration of LNA/LNB and BUC feeds, plug-in modules

Some modules can be configured either by jumper or by switch to provide an LNA/LNB or BUC feed either from an internally generated voltage or from the rear connector in the **ViaLiteHD** chassis. The diagram below shows how these are set.

Units with LNA/ LNB internal power supplies (options 1, 2, and 5) will be delivered set to “internal”. Units with external LNA power (option 3) will be set to “external”. Units with no LNA/LNB or BUC feed (option 0) will normally have no headers fitted to positions J15 or J16.

Manual configuration of LNA/LNB/BUC DC power feeds on TX, RX and TRX
2.8 Digital channel operation

The digital channel is independent of RF transmission and is capable of transmitting up to 20kbps digital data simultaneously. There are two built-in digital interfaces, one for RS422/485 signals and the other for RS232 or TTL signals. These are available on plug-in or blindmate modules on the chassis rear connector (see chassis handbook and sections 4.2.2 and 4.3.1.2) or directly on the module interface connector (Blue link and Yellow link modules, see sections 4.3.2 and 4.3.3). The link is unidirectional and therefore digital data transmits in the same direction as the RF link only.

Logic low on RTS_485 will shut down the RS422/485 line driver in RS485 application (see relevant RS485 standard for detail). Logic high or open circuit on RTS_485 will enable the line driver in the Rx module.

The digital information is conveyed on a Frequency Shift Keyed (FSK) carrier well below the operating band of the link (at approx. 500kHz). The unit is fitted with internal filtering to heavily attenuate this signal at the RF output. It may however still be observed as a sideband (second order) when measuring higher frequency signals. The carrier sideband will typically be a fixed level below the main power levels. The FSK 500kHz carrier will typically be suppressed by 70dBc, relative to RF carrier.

The 500kHz FSK tone can be removed by using software control, selecting the module and setting FSK to “disable”. This can also be implemented using SNMP.

To ensure operation of the digital channel the optical loss between the transmitter and receiver must be 0 – 10dB, operation outside of this range will result in high BER and potentially a total loss of function.

The digital channel option can be selected by digit eight of the part number (also used for LNA/LNB/BUC feed selection) details of the options available are given in sections 2.5, 2.6.1, 5 and 6.

Note: Modules equipped with a digital channel are factory delivered with FSK tone enabled.

2.9 GPS mode operation

GPS band units are equipped with hardware that can provide special GPS functions. They will mimic the operation of an active GPS amplifier through the fibre optic link.

2.9.1 GPS transmitter mode operation

Under normal non-fault conditions a ViaLiteHD GPS link will operate in an identical fashion to all other ViaLiteHD modules. However the transmitter is equipped with additional hardware that detects the DC current flowing from GPS transmitter RF input to the active GPS antenna.

If the current sunk by the active antenna falls below an alarm threshold of 5mA, (i.e. in the case of the LNA failing) the unit will generate an internal alarm. With GPS mode enabled, the transmitter laser will turn off. This will generate an alarm in the connected receiver module, as the connected unit will have a received light level alarm (RLL). The GPS mode can only be enabled and disabled when the unit is under software control.

Note: GPS Modules are factory delivered with “GPS mode” enabled.

If GPS mode is disabled the laser will be enabled in both alarm and non-alarm modes; irrespective of the antenna feed current if there is no other fault. Some major transmitter faults may also turn off the laser.

2.9.2 GPS receiver mode operation, units equipped with GPS load simulator

Under normal non-fault conditions a ViaLiteHD GPS link operates very similarly to a normal ViaLiteHD FOL. With GPS mode enabled, in non-fault conditions it presents a DC load at its RF output. This will typically sink 15mA (for input voltages in the range of 5 to 24V).
When the unit is in a fault condition; either by way of an internal fault, or due to low received light levels from the connected transmitter. It will disable the current sink. For most GPS receivers and time servers this will provide a basic alarm function. If GPS mode is disabled the DC load will be open circuit in both alarm and non-alarm modes.

**Note:** GPS Modules are factory delivered with “GPS mode” enabled.

### 2.10 Operating in gain control modes

Modules can be operated in four different gain control mode when operated with an SNMP and Web controller module. The SNMP and Web controller module is required for set up, under normal operation the module is under the control of its on board controller. Manual control is also available; this can be set using the hardware DIP switches.

For more information on this feature, please see section 2.13 of the ViaLiteHD SNMP controller handbook, HRC-1-HB.

### 2.11 High power and DWDM transmitter modules

The **ViaLiteHD** range includes high optical power thermo-electric cooled (TEC) transmitter modules which use the standard ViaLiteHD hardware and software. The modules are indicated by the use of the laser types (D,E and K), see section 5.

These provide a range of additional features.

- DWDM wavelength selection using 50GHz ITU grid
- High optical power output option offering ranges up to 100km without the need for optical amplification
- Superior temperature performance
- Extended temperature range, up to 70°C
- High optical gains
- Superior linearity and low noise
- Ultra-wide dynamic range
- LNB power options
- Packaging options including plug-in/ blindmate and Yellow link modules
- EN60825-1:2007 as CLASS 1 radiation emitting devices, safe under all conditions of normal use.

The TEC controller built into the high power laser thermally stabilises the laser, this eliminates a significant amount of the thermal gain variation in the high power transmitter. The graph below shows the gain variation for both a standard and a DWDM transmitter.
Change of Standard transmitter/ DWDM or high power transmitter gain at temperature, at 1.2GHz

Change of Standard receiver/ DWDM transmitter / Link gain at temperature, at 1.2GHz

The *ViaLiteHD* DWDM transmitter module can be used with a standard *ViaLiteHD* receiver module, BUT your optical link budget must ensure that the standard *ViaLiteHD* receiver is not optically overdriven. The standard *ViaLiteHD* receiver module should have an average optical input of no more than 4mW (6dBm). For applications with lower optical loss the *ViaLiteHD* high power receiver should be used. The minimum optical loss is shown in the table below.

<table>
<thead>
<tr>
<th>Transmitter</th>
<th>Standard Receiver</th>
<th>High power “K” receiver</th>
</tr>
</thead>
<tbody>
<tr>
<td>“D” Transmitter</td>
<td>No less than optical loss 1dB</td>
<td>No minimum link budget</td>
</tr>
<tr>
<td>“E” Transmitter</td>
<td>No less than optical loss 5dB</td>
<td>No minimum link budget</td>
</tr>
<tr>
<td>“K” Transmitter</td>
<td>No less than optical loss 5dB</td>
<td>No minimum link budget</td>
</tr>
</tbody>
</table>

Due to its additional complexity the *ViaLiteHD* High power and DWDM transmitter has a reduced number of options.

- It is only available as single transmitter.
- The digital channel option (as described in section 2.8) is not available.
- The input power supply range is more restricted than standard modules, see section 2.16.6. This will not effect the operation of your modules in any *ViaLiteHD* chassis but this will affect the voltage supply requirements for Blue link and Yellow link modules.

The high power transmitter will operate at high optical losses, the graph below shows how the noise figure of the optical transmitter increases with increased optical loss and dispersion cause by long cable lengths.
Increase in Noise Figure (dB) due to optical loss and dispersion in a long fibre cable.

**Note:** Design of a long range fibre optic link may require a complex system to achieve optimum performance. The system can include a range of optical components such as:

- DMDM multiplexers
- DWDM demultiplexers

The components will be required for combining and uncombining multiple DWDM transmitters, an incorrect choice of components will reduce the effectiveness of your system, particularly the isolation between different DWDM channels.

- Optical amplifiers such as Erbium Doped Fibre Amplifier (EDFA)
- Dispersion Compensating Fibre modules (DCF)

The use of these additional components will help manage the effect of very long fibres and optimised the performance of your system.

*ViaLite Communications engineering team will be happy to support your system design.*
2.11.1 High power and DWDM transmitter modules, thermal load

All DWDM modules have active thermal control, which produces extra heat load in their deployed environments. For this reason extra consideration is needed when planning the installation and deployment of these systems. As the cooling is active there is also the possibility that this might cause parasitic heat transfer if not properly controlled, which will reduce its operating efficiency and effective operating temperature range. If the DWDM active cooling TEC is unable to stabilise the laser power will be turned off, operation will only resume if the unit is powered cycled.

To maintain full operational temperature we suggest that you take the following actions.
- Do not place DWDM transmitter adjacent to each other
- When using a 3U chassis if more than 4 modules are fitted, forced air cooling should be used (flow rate ~100CFM or more)
- If housing DWDM transmitters in an outdoor housing contact ViaLite Communications for more details

2.12 L-Band HTS + reference modules

The ViaLiteHD L-Band HTS + reference link is designed for applications which require the transport of both an L-Band HTS (700-2450MHz) and a reference signal (5-20MHz). This is often required where remote equipment shares a common frequency reference, typically 10MHz. The modules transmit L-Band HTS and reference signals have two different optical paths, each optical path is separately modulated to minimise intermodulation distortion between the L-Band HTS and reference signals, to give optimal performance.

The modules are available with the following options.
- Separate L-Band HTS and reference RF ports OR RF diplexer that combines the RF and reference signals to a single RF port.
- Separate optical ports for L-Band HTS and reference OR optical combining using a WDM requiring only a single optical port.
- Switchable LNB power supply with 13V/18V and 22kHz tone.

There are two types of L-Band HTS and reference module; the “J” modules are used on the receive path (downlink) and the “K” modules are used on the transmit path (uplink).

The “J” frequency type, L-Band HTS + reference, receive path (downlink) module is designed for use in a SATCOM downlink. Where the 10MHz signal source is in the equipment room and L-Band HTS signal source is the remote LNB; in this case the two signals are travelling in the opposite directions.
2.12.1 L-Band HTS + reference downlink

When "J" receive path (downlink) modules with WDMs are used the optical paths are configured as below.
- The L-Band HTS optical path uses a 1550nm laser.
- The reference optical path uses a 1310nm laser.
- Receiver paths WDM channels are configured to match.

See sections 2.3.10.3 for additional notes on units fitted with diplexed RF ports.
See sections 2.3.10.4 for additional notes on units fitted with WDM combined ports.

Note: The fibre port of "J" modules without WDMs must be connected A>B and B>A as shown following.
Note: An optical wavelength must be specified for the "J" module RX as it has a laser transmitting the reference signal.
Note: The modules specified gain refers to the L-Band HTS path, the reference path gain is always 0dB with a -25dB TX and +25dB RX.

Remote Different types of receive path (downlink) "J" module Equipment room
2.12.2 L-Band HTS + reference uplink

The “K” frequency type, L-Band HTS + reference, transmit path (uplink) module is designed for use in a SATCOM uplink. Where the 10MHz signal source is in the equipment room and L-Band HTS signal sourced is the equipment room modem; in this case the two signals are travelling in the same direction.

When “K” transmit path (uplink) modules with WDMs are used the optical paths are configured as below.
- The L-Band HTS optical path uses a 1550nm laser.
- The reference optical path uses a 1310nm laser.
- Receiver paths WDM channels are configured to match.

Note: The fibre port of “K” modules without WDMs must be connected A>A and B>B as shown following.

Note: The modules specified gain refers to the L-Band HTS path, the reference path gain is always 0dB with a -25dB TX and +25dB RX.

See sections 2.3.10.3 for additional notes on units fitted with diplexed RF ports.
See sections 2.3.10.4 for additional notes on units fitted with WDM combined ports.
2.13 Susceptibility to DC pulses from ViaLiteHD receivers

All receiver modules will create a 1-2Vpeak DC transient from the RF output at start up into a 50Ω load (approximately 5V into a 1MΩ load). This may cause failure in some very sensitive spectrum analysers or similar equipment. Please check before connecting your equipment. Contact ViaLite Communications for more details.

2.14 Protection of ViaLiteHD equipment from DC pulses

All modules have AC coupled inputs and/or outputs and will be sensitive to large transients (>5V) applied at the RF connector. This may result in permanent damage to the modules, particularly to low frequency or wideband modules. DVB-T and L-Band HTS modules are designed to survive non repetitive DC pulse of up to 36V. To increase protection, BUC feed option “B” can be specified for GPS receiver modules to increases their robustness to DC pulses see section 2.6.1. Contact ViaLite Communications for more details.

2.15 Low frequency extension for IRIG and timing application

ViaLiteHD timing modules ‘T’ can be equipped with a low frequency extension allowing operation down to frequencies as low as 100Hz, this can be used to transport IRIG timing signal. IRIG format are described by a four digit code, the code is detailed below.

i.e. IRIG B122 is: 100 Bps, Sine wave (amplitude modulated), 1 kHz carrier, and Coded expressions BCD.

Digit 1 – Bit rate
ViaLiteHD RF links with low frequency extensions can carry all bit rate types as long as these are “less than” the carrier frequency. They will not carry bit rates equal to the carrier frequency.

<table>
<thead>
<tr>
<th>Code</th>
<th>Bit rate</th>
<th>Bit time</th>
<th>Bits per frame</th>
<th>Frame time</th>
<th>Frame rate</th>

</tbody>
</table>

Digit 2 – Modulation Type
ViaLiteHD RF links with low frequency extensions can carry modulation types 1 and 2.

ViaLiteHD serial digital links can be used to carry modulation type 0 with frequency carrier type 0, such as HRB-1-00-8R-28-L1310.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Digit 3 - Carrier frequency
ViaLiteHD RF links with low frequency extensions can operate with carrier frequency of 1kHz and above, supporting types 2,3,4 and 5.

ViaLiteHD serial digital links can be used to carry modulation type 0 with frequency carrier type 0, such as HRB-1-00-8R-28-L1310.

2.16 Module Interface ratings

2.16.1 Logic interface, TTL 5V

- Absolute maximum voltage rating: -0.5 to +5.5V
  - No damage
- Input, Logic Low (max): <0.8V
- Input, Logic High (min): >2.0V
- Output, Logic Low (max): <0.4V no load
- Output, Logic High (min): >4.8V no load
- Drive capability: 1k ohms
- Short circuit protection: No

2.16.2 Logic interface, RS232

- Absolute maximum voltage rating: -15 to +15V
  - No damage
- Input, Logic Low (max): <0.8V
- Input, Logic High (min): >2.6V
- Output, Logic Low (max): <3.2V no load
- Output, Logic High (min): >3.2V no load
- Drive capability: 3k ohms
- Short circuit protection: Yes

2.16.3 Logic interface, RS422/485

- Absolute maximum voltage rating: -12 to +12V
  - No damage
- Input, Logic Low (max): <0.8V
- Input, Logic High (min): >2.0V
- Output, Logic Low (max): <0.8V at 27 ohms
  - Common mode referenced to GND
- Output, Logic High (min): >2.0V at 27 ohms
  - Common mode referenced to GND
- Output Differential: >1.5V at 27 ohms
  - Common mode referenced to GND
- Output Differential: >2.0V at 50 ohms
  - Common mode referenced to GND
- Drive capability: 27 ohms
- Short circuit protection: Yes

2.16.4 Logic interface, I2C

- Absolute maximum voltage rating: -0.3 to +5.3V
  - No damage
- Input, Logic Low (max): <1.5V
- Input, Logic High (min): >3.5V
- Output, Logic Low (max): <0.6V no load
- Output, Logic High (min): >4.3V no load
- Drive capability: 1k ohms
- Short circuit protection: No

2.16.5 Logic interface, Open Drain, output

For details of operation see 2.3.5

- Operational pull up voltage: 0 to 15V
  - No damage
- Maximum load current: 50mA
- Short circuit protection: No

Note: Negative voltage on the output will be clamped by the FET body diode; you must ensure that these do not exceed current rating.
Note: When fitted in a chassis with a controller card (i.e. SNMP and web controller or summary alarm card) or if fitted active backplane (ie SATCOM6) the alarm lines maybe loaded and pulled up, see chassis handbook. Note: When fitted in a chassis or enclosure adjacent to a RF switch or RF splitter card, alarm lines maybe loaded and pulled up, see chassis handbook.

2.16.6 Power interface, +12V, input

ALL modules EXCEPT High power TX module
Nominal input voltage 12V
Typical input voltage range 11 to 13V
Maximum operational voltage range 9 to 16V

High power TX module ONLY
Nominal input voltage 12V
Maximum operational voltage range 11.5 to 13V

2.16.7 Analogue interface, laser diode bias, output

For details of operation see 2.16.7
Typical output voltage 1.25V for 50mA bias current
Typical output voltage range 0 to 2.5V
Maximum output voltage range -5 to +5V
Short circuit protection No

2.16.8 Analogue interface, photodiode received light level, output

For details of operation see 2.16.8
Typical output voltage 4.0V at 4.5dB optical input power
Typical output voltage range 1 to 4V
Maximum output voltage range 0 to +5V
Short circuit protection No

2.16.9 Internally generated LNB power supply and tone

Voltage set to LOW
Nominal output voltage 13.4V, Output select = LOW
Output voltage range 12.4 to 14.4V
Current rating 700mA per channel for single transmit channel (i.e. single transmitter or transceiver module). 350mA per channel for dual transmit channel, 700mA total (i.e. dual transmitter module).
Short circuit protection Yes

Voltage set to HIGH
Nominal output voltage 18.5V, Output select = HIGH
Output voltage range 17.5 to 19.5V
Current rating 700mA per channel for single transmit channel (i.e. single transmitter or transceiver module). 350mA per channel for dual transmit channel, 700mA total (i.e. dual transmitter module).
Short circuit protection Yes
Voltage BOOST active
Nominal output voltage increased 1V, Output boost = ENABLE

Voltage when set to AUX
Nominal output voltage 22V, AUX mode = ON
Output voltage range 21 to 23V
Current rating 150mA per channel for single transmit channel (i.e. single transmitter or transceiver module). 150mA per channel for dual transmit channel, 300mA total (i.e. dual transmitter module).
Short circuit protection Yes
TONE active
Nominal output level 0.6Vp-p, Tone Gen = ACTIVE
Output range 0.4 to 1.2Vp-p
Nominal frequency 22kHz
Frequency accuracy 20 to 24 kHz

2.16.10 RF connectors

Maximum RF input power, no damage +15dBm typical, check module spec in section 6, or contact ViaLite communication
Maximum usable input power See module P1dB rating in section 6
Maximum RF output power +15dBm typical dependent on type and application, contact ViaLite communication
See notes in sections 2.13 and 2.14.
2.16.11 Optical connections

Maximum optical input power, no damage: +8dBm, contact ViaLite communication for more details
Maximum usable input power: +6 dBm
Optical output power:
- +4.5dBm typical for standard 3mW TX modules
- +7dBm typical for DWDM 5mW modules
- +10.8dBm typical for 12mW modules

2.16.12 Logic interface, TX_AGC_ON and RX_AGC_ON (Yellow link and Blue link modules)

Absolute maximum voltage rating: -0.3 to +5.3V
Input, Logic Low (max): <1.5V
Input, Logic High (min): >3.5V
Impedance capability: 10k ohms
Short circuit protection: No
3 System integration

3.1 Link loss budget calculations

The link gain (transmitter RF input level to receiver RF output level) depends on the following factors:

- Optical loss (due to connector insertion loss and optical fibre loss).
- Transmitter gain setting.
- Receiver gain setting.

The actual link gain can be determined as follows:

\[
\text{Link gain} = \text{Nominal Link Gain} - (2 \times \text{optical loss}) \ [\text{dB}]
\]

(Where optical loss = connector insertion losses + fibre losses)

3.2 Optical loss versus gain

The additional electrical insertion loss in dB resulting from optical losses is equal to 2 times that of the optical loss in dB. This is due to the physics of the optical-to-electrical conversion process in the receiver. For example, a 1dB increase in optical insertion loss will result in a 2dB decrease in RF signal at the output of the optical receiver.

For single-mode fibre (e.g. SMF28), the optical loss at the 1310nm operating wavelength of the ViaLiteHD link is 0.4dB/km. For 1550nm operating wavelength, the optical loss of the ViaLiteHD link is 0.2dB/km. This is increased if the fibre is under excessive tension, compression or is bent into a small radius.

For clean, new, undamaged single-mode connectors, the optical insertion loss is typically 0.2dB per connector.

Note: The losses at the optical connections of the transmitter and receiver are allowed for during manufacture of the module, and may be ignored during link gain calculations.

For short links (<250m) containing no additional optical connectors, and in which the fibre is not subject to any strain, the optical path loss can be ignored.

3.3 Optical loss versus noise figure

As the optical loss increases there will be a corresponding increase in noise, the chart below shows the approximate relationship of optical loss to noise figure increase for a standard L-Band HTS link. Below are graphs that shows the change in noise figure of some popular link types. For links with high power transmitters see section 0.

Note: If you operate the ViaLiteHD modules in RLL AGC mode it is possible to mask optical loss variations, but this is not always desirable.
Increase in Noise Figure (dB) versus optical loss (dB), UHF/VHF link -15dB gain transmitter, +15dB gain receiver at 500MHz

Increase in Noise Figure (dB) versus optical loss (dB), GPS link -5dB gain transmitter, +5dB gain receiver at 1500MHz

Increase in Noise Figure (dB) versus optical loss (dB), GPS link -5dB gain transmitter, +20dB gain receiver at 1500MHz
3.4 **Gain versus frequency response**

The frequency response is not significantly affected by the gain setting of the attenuators used in **ViaLiteHD**. These have a flat frequency response over the full operating range of the product. Figures below are typical L-Band HTS modules responses.

![Gain plots versus TX gain (3dB steps) at RX gain 20dB](image)

![Gain plots versus TX gain (0.5dB steps) at RX gain 20dB](image)

![Gain plots versus RX gain (3dB steps) at TX gain -11dB](image)

![Gain plots versus RX gain (0.5dB steps) at TX gain -11dB](image)

3.5 **P1dB versus transmitter gain**

The input P1dB of the link is dependent on the transmitter gain. Increasing the transmitter gain will decrease the link input P1dB.

![Input P1dB versus TX gain setting (950/1200/1700/2150MHz)](image)
Input P1dB vs Tx gain setting (1226MHz/1575MHz)

GPS input P1dB versus Tx gain at Rx gain 5dB

Input P1dB vs Tx gain setting (100/500/1200/3000MHz)

Wideband input P1dB versus Tx gain at Rx gain 15dB

Output P1dB versus TX gain setting (950/1200/1700/2150MHz)

L band output P1dB versus Tx gain at Rx gain 20dB
GPS output P1dB versus Tx gain at Rx gain 5dB

Wideband output P1dB versus Tx Gain at Rx gain 15dB

3.6 P1dB versus receiver gain

The input P1dB of the link is not significantly affected by the receiver gain. Increasing the receiver gain have little effect on the link input P1dB, unless the output of the receiver approaches saturation. Figures below are typical L-Band HTS modules responses.
GPS input P1dB versus Rx gain at Tx gain -5dB

Wideband input P1dB versus Rx gain at Tx gain -15dB

L band output P1dB versus Rx gain at Tx gain -11dB
3.7 **P1dB, key observations**

The P1dB is highly dependent on the gain setting of the transmitter, in most configurations the linearity of the link is dependent on compression of the laser and its associated amplifier, that are both situated after the gain control stage in the transmitter. At high link gains it is possible to observe some compression in the receiver, but only when this approaches its maximum gain setting.

3.8 **Noise figure versus transmitter gain**

The noise figure of the link is dependent in the transmitter gain setting. Increasing the transmitter gain will reduce the noise figure. Figures shown below are typical L-Band HTS modules responses.
3.9 Noise figure versus receiver gain

The noise figure of the link is not significantly affected by the receiver gain. Increasing the receiver gain will slightly reduce the noise figure. Figures shown below are typical L-Band HTS modules responses.

![Noise figure versus RX gain setting (TX gain -11dB)](image)

3.10 Noise figure, key observations

The noise figure of the link is approximately linearly related to the transmitter gain setting. The noise figure reduces as the transmitter gain is increased. The receiver gain only has a minor impact on the link noise figure.

3.11 Link IP3

There is a relatively simple relationship between P1dB and IP3 for ViaLiteHD links. This is dependent on the compression characteristics of the amplifiers and laser used. The IP3 of a ViaLiteHD link is generally 12 dB above the P1dB.

3.12 Spurious free dynamic range

The dynamic range of the system is fundamentally set by the choice of laser and the optical loss. Transmitter and receiver gain can be used to optimise this for particular applications. All standard ViaLiteHD links are equipped with high power DFB lasers to give maximum dynamic range.

3.13 Phase noise

The ViaLiteHD link does not have any mixing or frequency conversion in the main RF path, but some residual phase noise can be measured. This phase noise is introduced by both the RF amplification elements and the laser control-loop, below are graphs that give typical performance of ViaLiteHD links. No attempt has been made to remove measure system noise; hence the results show the compound measurement system and link performance.

At both the lower frequency (10MHz) and the high frequency (4GHz) we believe that a significant noise contribution was made by the measurement system.
Phase Noise of a ViaLiteHD wideband link measured at 10MHz

Phase Noise of a ViaLiteHD wideband link measured at 500MHz
Phase Noise of a ViaLiteHD wideband link measured at 1000MHz

Phase Noise of a ViaLiteHD wideband link measured at 1500MHz
3.14 Link delay

The ViaLiteHD link introduces a small amount of delay to the system, similar to the contribution of an amplifier. The typical delay contribution is shown below. You should also account for delay through RF and fibre cables as these are likely to be much higher than the delay in the link fibre optic modules.
- Fibre optic link transmit and receive pair: 13.5 ns
- Fibre optic cable: 5 ns per meter, check manufacturer's specification
- RF cable: 3.5–5.5 ns per meter dependent on cable type.

<table>
<thead>
<tr>
<th>Cable Type</th>
<th>Delay per Meter</th>
</tr>
</thead>
<tbody>
<tr>
<td>LMR-195</td>
<td>4.0 ns</td>
</tr>
<tr>
<td>LMR-400</td>
<td>3.9 ns</td>

</tr>
<tr>
<td>RG-213</td>
<td>5.1 ns</td>
</tr>
<tr>
<td>RG-316</td>
<td>4.2 ns</td>
</tr>
</tbody>
</table>

Delays quoted are typical for these cable types, construction of cables of the same type will vary between manufacturers (i.e. foam/PTFE/solid polyethylene dielectric). If delay is critical please check your manufacturer's cable specification or electrically test the cables.

### 3.15 Group delay

The ViaLiteHD link has a broadband frequency response and only contributes a small amount of group delay. Plots below show typical group delay responses.

- **Group delay across the full band of a FOL:** 0.5 ns, peak to peak, typical
- **Group delay across any 36 MHz band of a FOL:** 0.1 ns, peak to peak, typical

All modules operating below L-Band HTS will be similar to the shown L-Band HTS.

![Group delay plot using a L-Band HTS Tx connected to an L-Band HTS Rx via a 0.5m fibre, 500 – 2500MHz](image1)

All modules operating above L-Band HTS will be similar to the Ultra Wideband.

![Group delay plot using an Ultra Wideband Tx connected to an Ultra Wideband Rx via a 0.5m fibre, 10 – 4200MHz](image2)
3.16 Effects of temperature

3.16.1 Effect of temperature on gain

The gain of a ViaLiteHD module will reduce as temperature increases. The graph below shows change in RF gain versus the room temperature gain. The graphs show the effect of temperature both inside and outside the specified operating temperature range. The typical gain versus temperature slope is defined in the data for the module types given in section 6. The graphs below show the performance of standard transmitters. High power and DWDM transmitters have superior performance, this is detailed in section 0.
3.16.2 Effect of temperature on noise figure

The link noise figure will be increased as temperature increases. The graph below shows change in noise figure versus the room temperature noise figure. The graph shows the effect of temperature across an extended temperature range.

3.16.3 Effect of temperature on P1dB

The link input P1dB will be increased as temperature increases. The graph below shows change in P1dB versus the room temperature P1dB. The graph shows the effect of temperature across an extended temperature range.
3.17 RF isolation

ViaLiteHD cards are designed to offer excellent isolation in operation, both isolation between the separate channels of dual modules and isolation from module to module in a chassis or enclosure mounted system.

The RF components for each channel of a card are fitted within a metal shield that gives a high level of isolation. Modules operating at 3GHz or more are fitted with an additional rear side shield that gives improved high frequency isolation.

3.17.1 RF isolation, plug-in and blindmate cards

The results are shown for an L-Band HTS test system that use a range of ViaLiteHD cards, fitted in two 3U chassis. The results show the performance of the complete system.

The uplink and downlink paths were composed of the following components:
- Uplink: Input > DTX (chassis B) > 2m of fibre > DRX (chassis A) > high isolation Switch (chassis A) > output
- Downlink: Input > DTX (chassis A) > 2m of fibre > DRX (chassis B) > output

In this configuration both switches are configured as through switches, with switch input A (DTX output) connected to switch output B (UL output).

3.17.2 RF isolation, plug-in and blindmate cards, within a module

The results below show the typical isolation between the two channels of a system using a dual card. The average isolation across the L-Band HTS frequency range is ~68dB. The dominant leakage is between channel A and channel B of both the DTX and the DRX.

Input: Port A of the DTX (chassis B)
Output: Port B of the Switch (chassis A)
Set up: Though gain is calibrated out, i.e. normal Uplink gain (~0dB for this system) is subtracted from the measured results.
Isolation between channel A and channel B of a dual module link with high isolation switch

3.17.3 RF isolation, plug-in and blindmate cards, between modules

The results below show the typical isolation between the uplink and downlink channels of a system using a dual card. The average isolation across the L-Band HTS frequency range is ~72dB. The dominant leakage path in this case is between adjacent DTX and DRX modules.

**Input:** Port A of the DTX (chassis A)  
**Output:** Port A of the DRX (chassis A)  
**Set up:** Though gain is calibrated out, i.e. normal Uplink gain (~0dB for this system) is subtracted from the measured results.

![Graph showing isolation between UL and DL using dual module link](image)

3.17.4 RF isolation, Blue link and Yellow link cards mounted in other ViaLite enclosures

Other ViaLiteHD enclosures are designed to offer similar isolation. Below is a plot taken between adjacent L-Band HTS modules in a SATCOM6 outdoor enclosure. The average isolation across the L-Band HTS frequency range is ~70dB in a SATCOM6.

**Test:** Isolation between L-Band HTS TX in slot 3 and L-Band HTS TX in slot 4 of SATCOM6  
**Set up:** Though gain is calibrated out, i.e. normal Uplink gain (~0dB for this system) is subtracted from the measured results.

![Graph showing isolation between UL and DL using dual module link](image)
3.18 2nd Harmonic rejection

The second harmonic rejection is strongly dependent on how your link is configured; the chart below shows the typical performance in the following configuration.

- **Link Type:** L-Band HTS
- **Device under test:** HRT-L1-8R-33-S1310
- **Link gain:** Set to default (-11/+20dB)
- **Input Tone:** 1GHz
- **Optical loss:** 0dB

Harmonic rejection = “Output power of fundamental (1GHz)” – “Output power of harmonic (2GHz)”

![2nd Harmonic rejection versus input power for an L-Band link](image-url)
3.19 **Typical system configuration with fixed gain modules**

The diagram below illustrates a typical communications system configuration.

The link gain for the fixed gain systems depends solely on the loss through the optical fibre link from transmitter to receiver. There is a Received Light Level (RLL) analogue monitor output on the receiver modules which can be used to measure the amount of laser light from the transmitter reaching the receiver during operation.

The RLL threshold alarm (which is triggered when the RLL drops below a preset level) can be used to determine if the optical link has been damaged or degraded.

3.20 **Commissioning of a communications link**

This commissioning procedure illustrates the processes required to install and set up a communications link with gain control. The example describes the commissioning of an L-Band HTS interfacility link.

We will be considering the installation of the following system.

A down converter provides an output signal in the L-band. The signal must be conveyed over 1500m of fibre, through a bulkhead at each station, to the modem. An alarm must trigger if the optical path is damaged.

1. Install the link, connecting all optical patch cords and cross-site fibre optic cables. Clean ALL optical connectors BEFORE mating with the modules.
2. Power up the equipment and allow 15 minutes to warm up.
3. Ensure that the RF power into the transmitter module is set to optimum for your system. Use a broadband RF power meter for this measurement. Typically this is the input level at which the link’s intermodulation distortion (IMD) is -40dBc. This value of input power can be calculated from your datasheet, it is typically 8dB less than the input P1dB.
4. Calculate the approximate optical attenuation in the fibre path. In our case, we have two bulkhead connectors @ 0.2dB each, 1500m of optical fibre @ 1310nm = 0.6dB, giving a total of 1dB of optical loss. The total RF gain of the system should be the nominal link gain minus 2x the optical loss.
5. Confirm that the RF output from the receiver is correct (to within measurement accuracy). If the loss is much higher (> 3dB) than calculated, the most likely explanation is dirt on the optical connectors. If this is the case, clean each connection in turn until the required system gain is restored.
4 Mechanical details

4.1 Shock and vibration

ViaLiteHD modules have been designed and tested to operate under significant mechanical stress; the tests run far exceed normal ground fixed operational use. This has been done to assure the robustness and reliability of the designs. Below are detailed the tests undertaken.

The system under test was a set of 3U chassis mounted modules, powered by chassis mounted AC PSUs. The system is detailed below:

- HRK3S 3U chassis
- HPS-3 AC PSU
- HPS-3 AC PSU
- HRC-1-09-8R-20 SNMP controller
- HRT-N1-6R-35-S1310 1GHz TX
- HRR-N1-6R-05 1GHz RX
- HRX-N1-8D-05-C1530 1GHz TRX blindmate
- F6R1/0.5 Optical test cable
- F6R1/0.5 Optical test cable
- Laptop (running SNMP web interface), not subject to vibration or shock

Vibration applied to the system:
- Vibration (Sinusoidal)
- Planes 3 planes, X/Y/Z
- Severity 5G, 25 – 2000 Hz, 1 octaves per minute.
- Duration 1/2 hour in each axis
- Standard IEC68-2-6: 1982

Shock applied to the system:
- Shock (half sine):
- Axis: 6 axis, X+/X-/Y+/Y-/Z+/Z-
- Severity 15g/11ms Shock (half sine)
- Duration 3 shocks each direction of each axes

A continuous wave RF test signal was applied to the TX FOL and monitored on the RX FOL via a spectrum analyser. The spectrum analyser used both maximum and minimum hold to capture performance extremes.

The test pass requirement was as follows:
- Continuous RF operation to specification.
- No SNMP error events to be logged.
- No front panel LED errors to be shown.
- No visible mechanical damage or degradation.
No measurable change in RF power level was detected. The system under test passed all the vibration and shock test, detailed above. A full test report is available, contact ViaLite Communications for more details.
4.2 Electrical interfaces

For typical levels and maximum ratings see details sections 2.14. In all cases GND is used as the voltage reference.

4.2.1 Signal description, alphabetic

This section gives a brief overview of the function of each signal line, more details are given in the following sections.

Dual receiver module DRX, with digital channel

For the dual channel modules (Transceiver, Dual transmitter or Dual receiver) ; channel 1 (i.e. RX, TX1 or RX1) is transmitted through the “A” fibre and channel 2 (i.e. TX, TX2 or RX2) is transmitted through the “B” fibre.

Note: Data on the connector is only for the module fitted in that 5HP slot. Connections in blue are optional and only available on some types of module.

4.3.1.3 Plug-in module – connections, backplane I2C

These connections are not externally available but maybe used to configure the module in some users equipment, they are available from the rear 30 way DIN 41612 connector. Only I2C and associated pins are shown below.

The MS is a TTL input; see section 2.16.1 for voltage levels. The modules are SELECTED by a HIGH and DESELECTED by a LOW, chassismodes have a weak internal pull up, hence they are SELECTED when open circuit.

4.3.2 Blue link module connections

4.3.2.1 Blue link module – dimensions

With mounting bracket

Without mounting bracket

All modules are supplied with a mounting bracket. The unit may be secured by:

- 2* M2.5 tapped hole on the underside
- OR
- 2* M3 clearance holes in the mounting bracket

Weight with mounting bracket fitted: 130g typical
Weight without mounting bracket fitted: 112g typical

Module Type
R - GPS/BDS receiver
V - Dual Receiver (optional in RF out)
T - Transponder (RF in, optical out)
U - Dual Transmitter (RF in, optical out)
X - Transmitter (Optical in, RF out)

Module Package
S - Green OEM Line
C - Classic Compatible
D - Classic compatible Green OEM Line
R - Classic plug-in
M - Blue OEM Line
N - Yellow OEM Line
A - Custom

Module Connector
H - XLR type
V - 50 Ohm N Type
B - 75 Ohm N Type
C - 50 Ohm MCX
D - 75 Ohm MCX

Electrical Connector
- Biwireable option

Optical Connector
- Biwireable option

Frequency
D - 100kHz-1GHz
E - 1-2GHz
F - 2-4GHz
G - 4-8GHz
H - 8-16GHz
I - 16-32GHz
J - 32-64GHz

Optical Connector
- ST/SC
- LC/PC
- MU
- FC/PC
- SCP/PC
- ST/PC

Options
- RX only
- RX only
- RX only
- TX only
- TX only
- TX/RX only
- RX and TX only

Note:
Options are dependent on module type.
Not all combinations of options are available. Contact ViaLite Communications for more details.

6.10 Technical specification - DVBT link (470-860MHz) (0dB gain link)

### Transmitter
- **Units**: UHF/VHF 50 ohms, UHF/VHF 75 ohms
- **Frequency range**: MHz 470-860
- **Impedance, RF connector**: 50Ω SMA, 75Ω BNC
- **VSWR**: typ 1:1.5
- **Link gain (TX gain / RX gain) default dB (nom)**: 0 (-15 / +15)
- **Link gain adjustment range dB (typ)**: 15.5
- **TX gain adjustment from default gain dB (typ)**: -6.5 to +9.0
- **RX gain adjustment range dB (typ)**: 15.5
- **RX gain adjustment from default gain dB (typ)**: -7.5 to +8.0
- **Gain adjustment step size Rx and TX dB (typ)**: 0.5
- **Flatness, fullband dB (max)**: ±1.0
- **Flatness, fullband dB (typ)**: ±0.3
- **Gain stability over temperature, Link dB (max)**: ±3
- **Gain stability dB (typ)**: 0.25 @ 24 hrs
- **IMD @ nominal output power dBm**: -20 / -20
- **P1dB at minimum TX gain dBm (typ)**: -8
- **IP3 at default gain dBm (typ)**: 14
- **Gain figure, at default gain dB (typ)**: 23
- **Gain figure, at maximum TX gain dB (typ)**: 15.5
- **Gain figure, 5dB optical loss dB (typ)**: 28
- **SDFR dB/Hz (typ)**: 110
- **Test port gain, transmitter dB (typ)**: No test port
- **Test port gain, receiver dB (typ)**: No test port
- **No damage input power dBm**: 15
- **LNA power**: Internal 12V @ 300mA
- **Power Tx W (typ)**: 1.9
- **Power Rx W (typ)**: 1.3

### Receiver
- **Units**: UHF/VHF 50 ohms, UHF/VHF 75 ohms
- **Frequency range**: MHz 470-860
- **Impedance, RF connector**: 50Ω SMA, 75Ω BNC
- **VSWR**: typ 1:1.5
- **Link gain (TX gain / RX gain) default dB (nom)**: 0 (-15 / +15)
- **Link gain adjustment range dB (typ)**: 15.5
- **TX gain adjustment from default gain dB (typ)**: -6.5 to +9.0
- **RX gain adjustment range dB (typ)**: 15.5
- **RX gain adjustment from default gain dB (typ)**: -7.5 to +8.0
- **Gain adjustment step size Rx and TX dB (typ)**: 0.5
- **Flatness, fullband dB (max)**: ±1.0
- **Flatness, fullband dB (typ)**: ±0.3
- **Gain stability over temperature, Link dB (max)**: ±3
- **Gain stability dB (typ)**: 0.25 @ 24 hrs
- **IMD @ nominal output power dBm**: -20 / -20
- **P1dB at minimum TX gain dBm (typ)**: -8
- **IP3 at default gain dBm (typ)**: 14
- **Gain figure, at default gain dB (typ)**: 23
- **Gain figure, at maximum TX gain dB (typ)**: 15.5
- **Gain figure, 5dB optical loss dB (typ)**: 28
- **SDFR dB/Hz (typ)**: 110
- **Test port gain, transmitter dB (typ)**: No test port
- **Test port gain, receiver dB (typ)**: No test port
- **No damage input power dBm**: 15
- **LNA power**: Internal 12V @ 300mA
- **Power Tx W (typ)**: 1.9
- **Power Rx W (typ)**: 1.3

### Optical connector
- **Type**: FC/APC
- **Wavelength**: nm 1310 ± 20
- **Type**: DFB - Distributed feedback laser
- **Power output dBm (typ)**: 4.5
- **Alert output**: Open drain alarm: OPEN: Alarm, CURRENT SINK: okay
- **Temperature range**: -10°C to +50°C
- **Temperature range**: -40°C to +70°C
- **Humidity**: RH 95% non-condensing humidity

---

- **Note**: Recommended input power @ 0dB optical loss
- **Note**: Nominal input power @ 1dB optical loss
- **Note**: Nominal output power @ 5dB optical loss
- **Note**: Default gain setting
- **Note**: Measured @ 500MHz
- **Note**: Relative to rear port @ 500MHz
- **Note**: All tests @ 25°C after 15 minutes warm up

</table>

Note: The minimum optical loss, if the received optical power of a standard RX module exceeds +5.8dBm this risks over driving the receiver and causing significant distortion and gross signal degradation.

The ViaLiteHD range of RF transmitter and receiver modules are precision engineered and calibrated for optimum performance and accuracy before dispatch.

In the event of any problems or queries arising with the equipment, please contact ViaLite Communications or your local agent.
8 **Product warranty**

*ViaLite Communications* guarantees its *ViaLiteHD* products, and will maintain them for a period of three years from the date of shipment and at no cost to the customer. Extended warranty options are available at the time of purchase.

Please note that the customer is responsible for shipping costs to return the module to *ViaLite Communications*.

*ViaLite Communications* or its agents will maintain its *ViaLiteHD* products in full working order and make all necessary adjustments and parts replacements during *ViaLite Communications*’ normal working hours provided that the Customer will pay at the rates currently charged by *ViaLite Communications* for any replacements made necessary by accident, misuse, neglect, wilful act or default or any cause other than normal use.

Claims must be made promptly, and during the guarantee period.

**IMPORTANT:**

Please contact both your selling agent and *ViaLite Communications* prior to returning any goods for warranty or non-warranty repairs. Goods will not be accepted without a valid Goods Return Number (GRN)
9 **FCC Approval**

Information to the user of *ViaLiteHD* products:

For a Class A digital device or peripheral, the following instructions are furnished to the user. This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense.
